Wilson Vuu . Jarvis Consulting

I am a Computer Science graduate from Wilfrid Laurier University with experience building full-stack applications and end-to-end data pipelines. At Cardata, I built backend services and APIs in Laravel and Node.js to handle reimbursement calculations and financial workflows, while contributing to the frontend with React.js and TypeScript, where I improved the architecture and built reusable components to make the application faster and easier to build on. Previously at Lowe-Martin, I automated data sanitization processes using Python and VBA, improving shipping accuracy and reducing manual effort through efficient batch processing. What excites and makes me passionate about the software industry is that there is always something new to learn or a better way to build something. I genuinely enjoy that process, whether it is picking up a new technology or finding a cleaner solution to a problem I have already solved.

Skills

Proficient: Java, Python, RDBMS/SQL, React.js, PHP (Laravel)

Competent: Docker, Linux/Bash, VBA, Node.js, HTML/CSS

Familiar: Django, C, Symfony/Composer, Agile/Scrum, PySpark

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_WilsonVuu

Cluster Monitor [GitHub]: The Linux Cluster Monitoring project is a system designed to track hardware specifications and resource usage across a networked Linux cluster. Each node collects its hardware profile on initialization and continuously logs CPU, memory, and disk metrics at scheduled intervals using crontab, with all data stored in a centralized PostgreSQL database managed through Docker. The data is organized into two tables covering hardware specifications and ongoing resource usage, giving the LCA team at Jarvis the visibility to monitor system performance over time and make informed decisions around resource allocation.

Java Grep App [GitHub]: Implemented a Java application that replicates the Unix grep command, taking a regex pattern, a root directory, and an output file as arguments. The app recursively searches all files in the directory and writes matching lines to the output. Built using Java's Streams API with a lazy pipeline using Java NIO's Files.walk() for file traversal, flatMap to flatten each file's lines into a single stream, and filter to match the regex, ensuring memory stays low regardless of file or directory size. Used Maven for dependency and build management, packaging the app into a fat jar with all dependencies bundled. Containerized the application with Docker and pushed the image to DockerHub.

Python Data Analytics [GitHub]: Analyzed two years of transactional data (2009–2011) for London Gift Shop (LGS), a UK-based wholesale retailer, to find actionable insights around customer retention and revenue growth. Applied RFM segmentation to identify high-value customers, quantify at-risk revenue, and support targeted win-back campaigns. Explored monthly sales trends, seasonal peaks, new vs. existing customer revenue splits, and customer health status over time to inform marketing and inventory decisions. Built using Python (pandas, NumPy, matplotlib, seaborn) in a Jupyter Notebook environment, with data stored in a PostgreSQL data warehouse, both running in Docker containers connected via a shared bridge network.

Highlighted Projects

Inventory Management System: Developed a full-stack inventory management system using Spring Boot, Java, React.js, and MySQL, designed to help businesses organize and track item quantities and stock levels. Built with the goal of learning new technologies and understanding how real-world business applications are structured, the project features a relational MySQL schema modeling items, categories, and suppliers alongside a RESTful API to manage inventory data across the entire system.

Smart Investors: Developed a full-stack stock market simulator using PHP, JavaScript, and MariaDB to enable users to practice investment strategies in a semi real-time environment. Designed a relational database schema to track user portfolios and transaction history, and integrated the Yahoo Finance API to provide live market data for accurate portfolio tracking.

Professional Experiences

Software Developer/Data Engineer, Jarvis (2026-present): Developed and delivered a range of software and data engineering projects including a Linux cluster monitoring system, a Java grep application, and a Python data analytics proof of concept in an Agile environment. Built backend services and data pipelines across Java and Python, working in Linux environments with tools such as Docker, PostgreSQL, and Bash.

Full Stack Software Engineer, Cardata (Nov 2021-Jul 2022): Integrated React.js and TypeScript frontends with Laravel and Node.js backend services to improve system scalability and the user experience of daily payment processing. Engineered a dynamic PDF export system to automate report generation and introduced a localization pipeline achieving 93% translation coverage.

Data/Programmer Analyst Intern, Lowe-Martin (May 2019-Sep 2019): Used VBA and Python to automate the sanitization of CSV data, resulting in an increase in shipping accuracy. Built custom report generation tools in Microsoft Access and Excel to display and present shipping and address data for internal review and validation. Built a prototype of the corporate website using HTML/CSS and JavaScript as a visual mockup for leadership to review and approve.

Education

Wilfrid Laurier University (2017-2022), Bachelor of Science, Computer Science

Miscellaneous

- Badminton player: Still a beginner, but I play in weekly recreational sessions. It's a fun way to stay active, and I really enjoy the quick pace and the social side of the game.
- Hiking enthusiast: I love hitting local trails and getting lost in conservation areas for a few hours. For me, it's a good way to clear my mind and recharge.
